Workshare Protect

The quick and simple way to clean documents of sensitive metadata

Protect your business from data loss events

Apply company-wide security policies

Protect files however they're sent

Workshare Protect quickly and simply removes potentially sensitive metadata from any files you want to send over email. This protects you from sharing data unintentionally.

Protect your files and your reputation

Inadvertently sending documents that contain hidden data, or metadata, can put client information and your business reputation at risk.

Workshare's fast and simple file protection solution can be integrated with Outlook to remove sensitive data before it's shared.

Policies can be created and customized by IT groups to be as rigid as needed, then any data identified as sensitive, according to those policies, will be removed without interrupting the end user or their workflow.

Integrated protection for your files

Workshare Protect is able to automatically assess the risk associated with a file and, where needed, remove review details and change histories, document properties, statistics and file dates, reviewer information, hidden text or macros, and custom properties.

Because the solution is integrated with Outlook, this takes place behind the scenes and is complete before you hit send.

Actively protect email attachments

It's also possible to receive notifications when metadata has been detected in an email attachment, giving the option to clean it, convert it to a PDF, or replace the attachment with a secure link when sharing large documents.

Prevent data loss

Make Workshare Protect part of your data loss prevention strategy by ensuring only the information you intend to share with other people is in the documents you send.

Don't gamble with high stakes documents

When you're working on sensitive matters, the stakes are high. You can't afford to gamble with the information you deal with. So, make Workshare the ace up your sleeve and protect every file you send.

Workshare Protect Server

Extend file security beyond the desktop

Workshare Protect can also be installed at a server level to clean documents of metadata when they're emailed from any device.

Protect data beyond the desktop

Workshare Protect Server extends your corporate data security policies to attachments sent by email, webmail and mobile devices.

Attachments sent from difference devices are scanned for metadata and then cleaned, converted to PDF, sent as a secure link or blocked altogether.
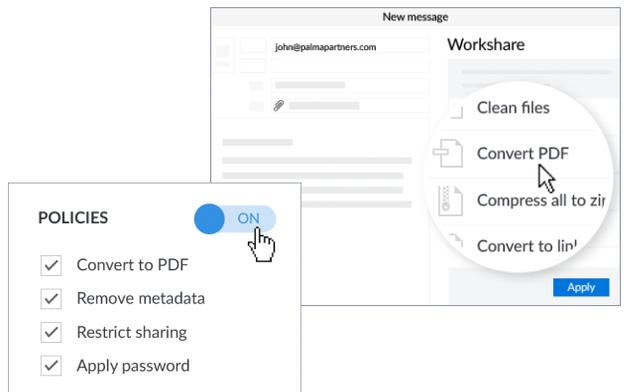

360 degree cover

Data protection and secure file transfer can be extended to all endpoints, meaning your firm's and your clients' data is protected whether you're working from the desktop, a smartphone or a tablet.

Tailored to your business

Set up granular data policies with contextual data awareness, and tailor file security for specific departments or teams in your business.

It's quick and seamless to integrated Protect Server with Exchange, so documents can be secured without interrupting users being tied to their desktop.
